

## Ventilated Containers

Ventilated container is for transporting and storing the cargos which needs air exchange with external environment: grain, coffee, cacao, etc. Typically ventilated container is standard or bulk container equipped with additional openings for natural ventilation.

Common notations:

20 foot ventilated container, 20 Ventilated Container, 20 VC, 20 VT,

40'FT ventilated container, 40 foot ventilated container.

Ventilated container provides ventilation with opening holes in the upper and lower parts of the wall. The hole arrangement and configuration holds any precipitation into the container.

Some container types have specially adapted locking rings, whereby loads weighing no more than 1 t are placed and locked in these most ventilated areas at the top and at the corners of the container.

Sea vented containers are a standard container type with appropriate ventilation perforations that provide passive ventilation. They are part of a specialty container type.
